

Running Board Bracket Pad & Picture

By Lynn Sondena

Sandy, Oregon

Here is a tiny tip I use to prevent damage to my shin bone when working on the Model A chassis during the restoration process. I place a piece of round pipe insulation over the brackets so if you walk into them they are padded and don't bruise your shins. I leave the padding sticking out about one inch past the end of the metal. Figure 1 shows the pad correctly installed on the running board bracket.
